Variable Frequency Drive

# Ecology Compact Easy Inverter

Hitachi Industrial Equipment Systems Co., Ltd.

Call 1(800)985-6929 for Sales

hitachiacdrive.com

## Compact, full-featured new generation

Empowered with cutting-edge functions yet easy-to-install, L200 series delivers a modern, global variable frequency drive

## 1

### **Operation Source Switch**

Run command/frequency source are easy to select with a DIP switch. Default is keypad settings. Sliding the switch changes the sources to the control terminals.

### **Improved PID Control**

Reverse PID function changes the sign of the deviation value which is the difference between target and feedback values. Upper and lower limits from a target value can be imposed on the inverter output frequency.

### Logic and Output Timing functions

Output terminals can be assigned logical operators AND, OR and XOR with RUN, AL and so on. ON and OFF delay times are settable for each output terminal. Allows for more flexible system design.

### **Analog Setpoint Calculate Functions**

An offset frequency can be added to or subtracted from the output frequency when ADD terminal is ON. For example, if output frequency setting is 40Hz and offset frequency is 5Hz, output frequency becomes 45Hz (or 35Hz) when ADD terminal is ON.

### **Model Configuration**

## drive

### easy-to-use, easy-to-maintain. solution.

L200-\*\*\*\*EF Type

### Integrated EMC Filter

Reduces electromagnetic noise. (on European-Version unit only. Effective for only single phase input for 200V class models)

#### Easy Maintenance

Detachable cooling-fan.

### Versatile Functions

- Pure analog monitor output (8-bit, 0-10V DC)
- External thermistor terminal (PTC)
- · Side-by-side installation
- Second motor setting
- Over-voltage suppression at deceleration
- 3-wire control
- Analog input selection
- · Second acceleration/deceleration setting
- Jogging
- Unattended start protection (USP)
- · Analog input wire-break detection

### Global Performance

#### Conformity to global standards. CE, UL, c-UL and c-Tick approvals.

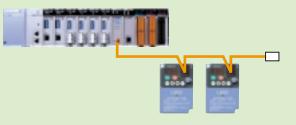

LISTED

UL,c-UL

### **RS-485 Serial Port**

An RS-485 communication port with Modbus®-RTU protocol is integrated. Easier for network operation.

CE

Hitachi variable frequency drives (inverters) in this brochure are produced at the factory registered under the ISO 14001 standard for environmental management system and the ISO 9001 standard for inverter quality management system.

	н	+10V analog reference		10V DC, 10mA max
Frequency	0	Analog input, voltage		0 to 10V DC, input impedance10kohm
setting	OI	Analog input, current	$(1k\Omega-2k\Omega)$ DC0-10V DC4-20mA $(1k\Omega-2k\Omega)$ Input impedance 10kΩ Input impedance 250kΩ If no input terminal is assigned to [AT](analog input selection), the inverter outputs	4 to 20mA DC, input impedance 250ohm
	L	Common for inputs	sum of O(voltage) and O(current) frequency. Assign [AT] for input terminal to selecting frequency source from voltage or current.	-
Output	12	Intelligent (programable) output terr RUN(run signal), FA1(Frequency ar	ninals, selection from: rrival type 1 -constant speed), FA2(Frequency arrival type 2 -over-frequency),	Open collector output
Output signals	11		, OD(Output deviation for PID control), AL(alarm signal), DC(Wire brake detect on ge comparison), NDc(Network Disconnection), LOG(Logic operation result).	L level at operation (ON) 27V DC, 50mA max.
	CM2	Common for intelligent output termin	nals	-
	AL2	Relay contact (alarm output)		AC250V 2.0A (Resistive load) 0.2A (cosφ =0.4)
Relay output	AL1	terminals (programable, function is selectable same as /////	//////////////////////////////////////	DC30V 3.0A (Resistive load) 0.6A (cos φ =0.4)
	AL0	intelligent output terminals).	Trip/Power OFF : AL0-AL2 closed	(minimam) AC100V 10mA DC 5V 100mA

### **Protective Functions**

#### **Error Codes**

Name	Cause(s)		Display on digital operator	Display on remote operator/copy unit
		While at constant speed	E 0 I	OC.Drive
Over current	The inverter output was short-circuited, or the motor shaft is locked or has a heavy load. These conditions cause excessive current for the inverter, so the inverter	During deceleration	<u>503</u>	OC.Decel
	output is turned OFF.	During acceleration	E 03	OC.Accel
		Others	E 04	Over.C
Overload protection *1	When a motor overload is detected by the electronic thermal function, the inverter tri its output.	ps and turns OFF	E 05	Over.L
Over voltage protection	When the DC bus voltage exceeds a threshold, due to regenerative energy from the	motor.	E 07	Over.V
EEPROM error *2,3	When the built-in EEPROM memory has problems due to noise or excessive temper trips and turns OFF its output to the motor.	,	E 08	EEPROM
Under-voltage error	A decrease of internal DC bus voltage below a threshold results in a control circuit fault. This condition can also generate excessive motor heat or cause low torque. The inverter trips and turns OFF its output.			Under.V
CPU error	A malfunction in the built-in CPU has occurred, so the inverter trips and turns OFF it motor.	E 22	CPU COMM.ERR	
External trip	A signal on an intelligent input terminal configured as EXT has occurred. The inverter trips and turns OFF the output to the motor.		E 12	EXTERNAL
USP *4	When the Unattended Start Protection (USP) is enabled, an error occurred when po while a Run signal is present. The inverter trips and does not go into Run Mode until cleared.	E 13	USP	
Ground fault *5	The inverter is protected by the detection of ground faults between the inverter output and the motor during powerup tests. This feature protects the inverter, and does not protect humans.		E 14	GND.Flt
Input over-voltage	When the input voltage is higher than the specified value, it is detected 100 seconds after powerup and the inverter trips and turns OFF its output.		E 15	OV.SRC
Inverter thermal trip	When the inverter internal temperature is above the threshold, the thermal sensor in the inverter module detects the excessive temperature of the power devices and trips, turning the inverter output OFF.		E 21	OH FIN
Driver error	An internal inverter error has occurred at the safety protection circuit between the CPU and main driver unit. Excessive electrical noise may be the cause. The inverter has turned OFF the IGBT module output.		E 30	DRIVE
Thermistor	When a thermistor is connected to terminals [PTC] and [L1] and the inverter has sensed the temperature is too high, the inverter trips and turns OFF the output.		<u>E 35</u>	TH
Communications error	The inverter's watchdog timer for the communications network has timed out.			COMM

Note 1: Reset operations acceptable 10 seconds after the trip.

Note 2: If an EEPROM error (E08) occurs, be sure to confirm the parameter data values are still correct.

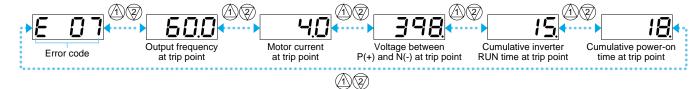

Note 3: EEPROM error may occer at power-on after shutting down the power while copying data with remote operator or initializing data. Shut down the power after completing copy or

initialization.

Note 4: USP error occures at reseting trip after under-voltage error (E09) if USP is enabled. Reset once more to recover.

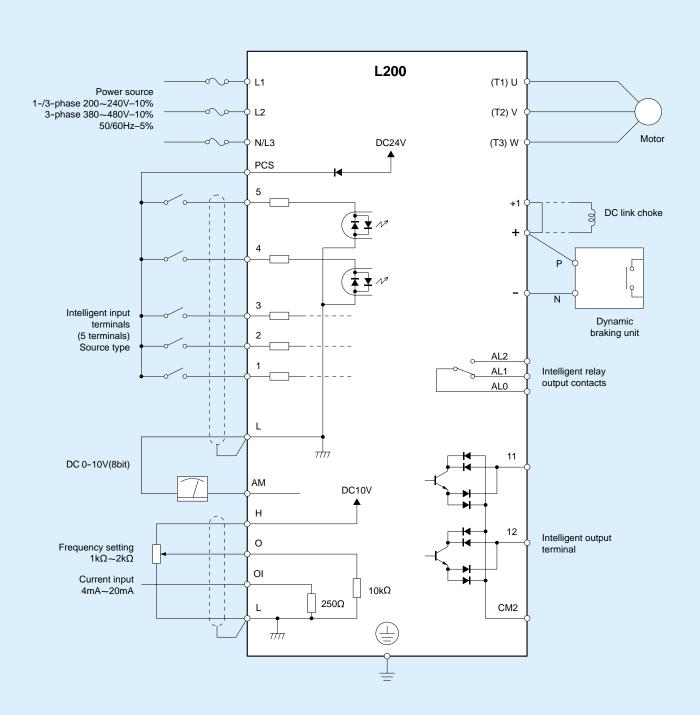

Note 5: Ground fault error (E14) cannot be released with resetting. Shut the power and check wiring.

#### How to access the details about the present fault

### **Connecting Diagram**

#### Source type logic

Note 1: Common terminals are depend on logic.

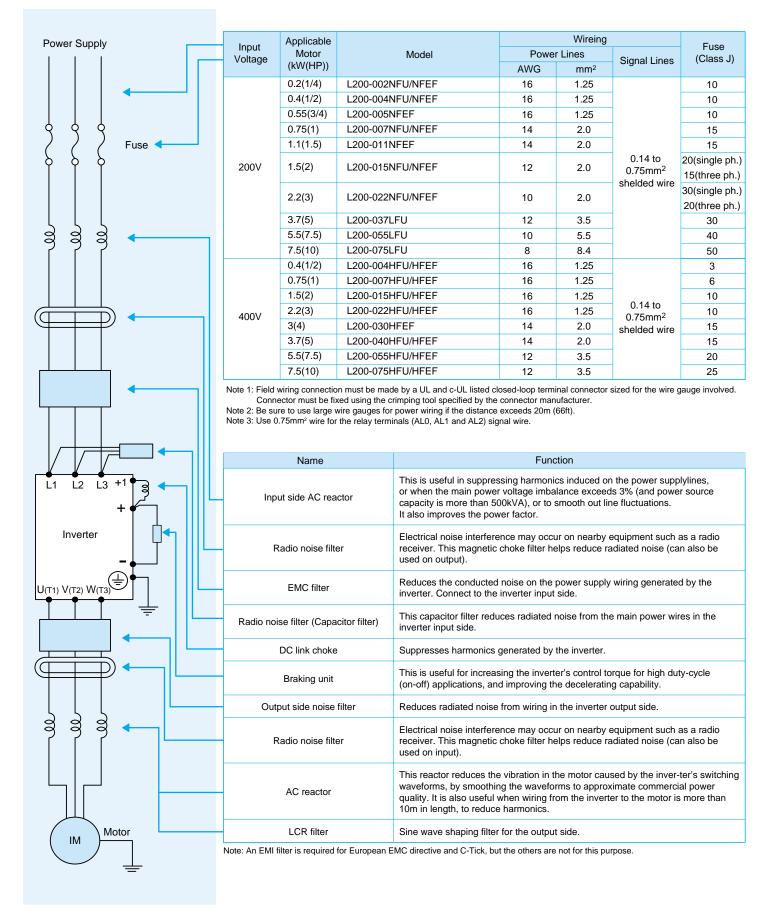

Terminal	1,2,3,4,5	H,O,OI	11,12	
0	Sink logic : L		CM2	
Common	Source logic : PCS	L	CIVIZ	

Note 2: Choose proper inverter input volotage rating.

### **For Correct Operation**

Application to Motors Application to general-purpose motors

Operating frequency	The overspeed endurance of a general-purpose motor is 120% of the rated speed for 2 minutes (JIS C4,004). For operation at higher than 60Hz, it is required to examine the allowable torque of the motor, useful life of bearings, noise, vibration, etc. In this case, be sure to consult the motor manufacturer as the maximum allowable rpm differs depending on the motor capacity, etc.
Torque characteristics	The torque characteristics of driving a general-purpose motor with an inverter differ from those of driving it using commercial power (starting torque decreases in particular). Carefully check the load torque characteristic of a connected machine and the driving torque characteristic of the motor.
Motor loss and temperature increase	The torque characteristics of driving a general-purpose motor with an inverter differ from those of driving it using commercial power
Noise	When run by an inverter, a general-purpose motor generates noise slightly greater than with commercial power.
Vibration	When run by an inverter at variable speeds, the motor may generate vibration, especially because of (a) unbalance of the rotor including a connected machine, or (b) resonance caused by the natural vibration frequency of a mechanical system. Particularly, be careful of (b) when operating at variable speeds a machine previously fitted with a constant speed motor. Vibration can be minimized by (1) avoiding resonance points using the frequency jump function of the inverter, (2) using a tire-shaped coupling, or (3) placing a rubber shock absorber beneath the motor base.
Power transmission mechanism	Under continued, low-speed operation, oil lubrication can deteriorate in a power transmission mechanism with an oil-type gear box (gear motor) or reducer. Check with the motor manufacturer for the permissible range of continuous speed. To operate at more than 60 Hz, confirm the machine , s ability to withstand the centrifugal force generated.

#### Application to special motors

The allowable rotation range of continuous drive varies depending on the lubrication method or motor manufacturer. (Particularly in case of oil lubrication, pay attention to the low frequency range.)
For use of a brake-equipped motor, be sure to connect the braking power supply from the primary side of the inverter.
There are different kinds of pole-change motors (constant output characteristic type, constant torque characteristic type, etc.), with different rated current values. In motor selection, check the maximum allowable current for each motor of a different pole count. At the time of pole changing, be sure to stop the motor. Also see: Application to the 400V-class motor.
The rated current of a submersible motor is significantly larger than that of the general-purpose motor. In inverter selection, be sure to check the rated current of the motor.
Inverter drive is not suitable for a safety-enhanced explosion-proof type motor. The inverter should be used in combination with a pressure-proof explosion-proof type of motor. *Explosion-proof verification is not available for L200 Series.
In most cases, the synchronous (MS) motor and the high-speed (HFM) motor are designed and manufactured to meet the specifications suitable for a connected machine. As to proper inverter selection, consult the manufacturer.
A single-phase motor is not suitable for variable-speed operation by an inverter drive. Therefore, use a three-phase motor.

#### Application to the 400V-class motor

A system applying a voltage-type PWM inverter with IGBT may have surge voltage at the motor terminals resulting from the cable constants including the cable length and the cable laying method. Depending on the surge current magnification, the motor coil insulation may be degraded. In particular, when a 400V-class motor is used, a longer cable is used, and critical loss can occur, take the following countermeasures:

- (1) install the LCR filter between the inverter and the motor,
- (2) install the AC reactor between the inverter and the motor, or
- (3) enhance the insulation of the motor coil.

#### Notes on Use

Drive	

Run/Stop	Run or stop of the inverter must be done with the keys on the operator panel or through the control circuit terminal. Do not operate by installing a electromagnetic contactor (MC) in the main circuit.
Emergency motor stop	When the protective function is operating or the power supply stops, the motor enters the free run stop state. When an emergency stop is required or when the motor should be kept stopped, use of a mechanical brake should be considered.
High-frequency run	A max. 400Hz can be selected on the L200 Series. However, a two-pole motor can attain up to approx. 24,000 rpm, which is extremely dangerous. Therefore, carefully make selection and settings by checking the mechanical strength of the motor and connected machines. Consult the motor manufacturer when it is necessary to drive a standard (general-purpose) motor above 60 Hz. A full line of high-speed motors is available from Hitachi.

#### Installation location and operating environment

Avoid installation in areas of high temperature, excessive humidity, or where moisture can easily collect, as well as areas that are dusty, subject to corrosive gasses, mist of liquid for grinding, or salt. Install the inverter away from direct sunlight in a well-ventilated room that is free of vibration. The inverter can be operated in the ambient temperature range from -10 to 50°C. (Carrier frequency and output current must be reduced in the range of 40 to 50°C.)

### **For Correct Operation**

#### Main power supply

Installation of an AC reactor on the input side	In the following examples involving a general-purpose inverter, a large peak current flows on the main power supply side, and is able to destroy the converter module. Where such situations are foreseen or the connected equipment must be highly reliable, install an AC reactor between the power supply and the inverter. Also, where influence of indirect lightning strike is possible, install a lightning conductor. (A) The unbalance factor of the power supply is 3% or higher. (Note) (B) The power supply capacity is at least 10 times greater than the inverter capacity (the power supply capacity is 500 kVA or more). (C) Abrupt power supply changes are expected. Examples: (1) Several inverters are interconnected with a short bus. (2) A thyristor converter and an inverter are interconnected with a short bus. (3) An installed phase advance capacitor opens and closes. In cases (A), (B) and (C), it is recommended to install an AC reactor on the main power supply side. Note: Example calculation with V <sub>ss</sub> = 205V, V <sub>st</sub> = 201V, V <sub>tπ</sub> = 200V V <sub>Rs</sub> : R-S line voltage, V <sub>st</sub> : S-T line voltage, V <sub>tπ</sub> : T-R line voltage Mean line voltage $\frac{Max. line voltage (min.) - Mean line voltage}{Mean line voltage} \times 100$ $= \frac{V_{Rs}-(V_{Rs}+V_{st}+V_{th})/3}{(V_{Rs}+V_{st}+V_{th})/3} \times 100 = \frac{205-202}{202} \times 100 = 1.5(\%)$
Using a private power generator	An inverter run by a private power generator may overheat the generator or suffer from a deformed output voltage waveform of the generator. Generally, the generator capacity should be five times that of the inverter (kVA) in a PWM control system, or six times greater in a PAM control system.

#### **Notes on Peripheral Equipment Selection**

Wiring connections		<ul> <li>(1) Be sure to connect main power wires with R(L1), S(L2), and T(L3) terminals (input) and motor wires to U(T1), V(T2), and W(T3) terminals (output). (Incorrect connection will cause an immediate failure.)</li> <li>(2) Be sure to provide a grounding connection with the ground terminal (()).</li> </ul>
	Electromagnetic contactor	When an electromagnetic contactor is installed between the inverter and the motor, do not perform on-off switching during running operation.
Wiring between inverter and motor	Thermal relay	<ul> <li>When used with standard applicable output motors (standard three-phase squirrel-cage four-pole motors), the SJ200 Series does not need a thermal relay for motor protection due to the internal electronic protective circuit. A thermal relay, however, should be used:</li> <li>during continuous running outside a range of 30 to 60 Hz.</li> <li>for motors exceeding the range of electronic thermal adjustment (rated current).</li> <li>when several motors are driven by the same inverter; install a thermal relay for each motor.</li> <li>The RC value of the thermal relay should be more than 1.1 times the rated current of the motor. Where the wiring length is 10 m or more, the thermal relay tends to turn off readily. In this case, provide an AC reactor on the output side or use a current sensor.</li> </ul>
Installing a c	ircuit breaker	Install a circuit breaker on the main power input side to protect inverter wiring and ensure personal safety. Choose an inverter- compatible circuit breaker. The conventional type may malfunction due to harmonics from the inverter. For more information, consult the circuit breaker manufacturer.
Wiring distance Earth leakage relay Phase advance capacitor		The wiring distance between the inverter and the remote operator panel should be 20 meters or less. When this distance is exceeded, use CVD-E (current-voltage converter) or RCD-E (remote control device). Shielded cable should be used on the wiring. Beware of voltage drops on main circuit wires. (A large voltage drop reduces torque.)
		If the earth leakage relay (or earth leakage breaker) is used, it should have a sensitivity level of 15 mA or more (per inverter).
		Do not use a capacitor for power factor improvement between the inverter and the motor because the high-frequency components of the inverter output may overheat or damage the capacitor.

#### **High-frequency Noise and Leakage Current**

- (1) High-frequency components are included in the input/output of the inverter main circuit, and they may cause interference in a transmitter,
- radio, or sensor if used near the inverter. The interference can be minimized by attaching noise filters (option) in the inverter circuitry.
- (2) The switching action of an inverter causes an increase in leakage current. Be sure to ground the inverter and the motor.

#### Lifetime of Primary Parts

Because a DC bus capacitor deteriorates as it undergoes internal chemical reaction, it should normally be replaced every five years. Be aware, however, that its life expectancy is considerably shorter when the inverter is subjected to such adverse factors as high temperatures or heavy loads exceeding the rated current of the inverter. The approximate lifetime of the capacitor is as shown in the figure at the right when it is used 12 hours daily (according to the "Instructions for Periodic Inspection of General-Purpose Inverter " (JEMA).)Also, such moving parts as a cooling fan should be replaced. Maintenance inspection and parts replacement must beperformed by only specified trained personnel.

#### Precaution for Correct Usage

- Before use, be sure to read through the Instruction Manual to insure proper use of the inverter.
- Note that the inverter requires electrical wiring; a trained specialist should carry out the wiring.
- The inverter in this catalog is designed for general industrial applications. For special applications in fields such as aircraft, outer space, nuclear power, electrical power, transport vehicles, clinics, and underwater equipment, please consult with us in advance.
- For application in a facility where human life is involved or serious losses may occur, make sure to provide safety devices to avoid a serious accident.
- The inverter is intended for use with a three-phase AC motor. For use with a load other than this, please consult with us.
